Eye infections

To whom it may concern,

As per the clinical safety & efficacy studies conducted by Oculus Innovative Sciences; Dermacyn / Microdacyn can be considered safe in assisting the treatment of eye infections.

In conclusion, using Dermacyn / Microdacyn as an adjuvant in the treatment of eye infections is safe and may help eradicate the infection when combined with antibiotic treatment.

Subject: Sterility Statement

To whom it may concern,

This letter is to declare that our EU Microcyn Technology products - Microdacyn- are sterile CE approved product. (as also indicated on all packages)

Microdacyn has not been sterilized by secondary means (e.g. Gamma sterilization) however is a sterile solution itself because of its antimicrobial active ingredient Hypochlorous Acid (HOCI). Sterilization Validation has also demonstrated that sterility is guaranteed during manufacturing.

Microdacyn’s efficacy and properties are guaranteed at least up to 60* days after opening. Consequently, product is suitable for repeated use on multiple patients during this period.

*(Shelf life was 30 days; however, more extensive shelf life testing has shown that stability is guaranteed for at least 60 days. As of 2015, this will be listed on all product labels)

Sincerely,

B.H.J.H. de Brouwer
